

Calculating Table cloth sizes

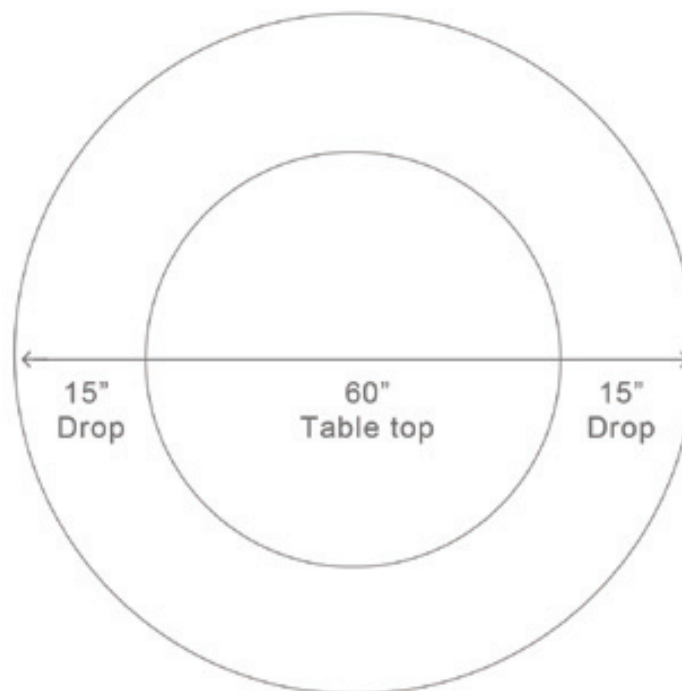

Here's a foolproof way to order the perfect size cloth for your table.

For a round table: Simply measure the diameter, then how much drop you require. (In other words, how far down the cloth will hang from the edge.)

Now just multiply the drop x 2 and add the total to the diameter of the table (see diagram)

For a long table: just measure the length, then multiply the drop x 2 and add altogether to find the size you require.

NB: 1 metre = 39 "

For example:

If you have 60 " (5') round table and would like the tablecloth to have a 15" drop, you would multiply:

$15" \times 2 = 30"$ and add the table's diameter of 60", which means you would need a 90" round tablecloth.
